Summary

Software Engineer working on Java and Spring Boot systems in banking and regulated enterprise environments. Strong in secure, auditable workflows with measurable gains in processing time and query performance.

Technical Skills

Languages & Frameworks: Java, Python, SQL, Spring Boot, Django, REST APIs

Data & Security: MySQL, Redis, RBAC, Authentication, Authorization, JWT, OAuth2

Engineering: System Design, Approval Workflows, Background Processing, Performance Optimization, Document Automation

Experience

Ardur Technology

Software Engineer

April 2024 – Present

Pune, India

Banking Workflow Platform | *Java, Spring Boot, MySQL*

- Built Spring Boot services for customer onboarding, credit processing and multi-level transaction approvals under bank-defined approval policies.
- Implemented maker-checker approval routing across 6 authorization levels, with role-scoped permissions at each level.
- Developed approval, reporting and audit-tracking modules, recording every workflow state transition for audit review.
- Rewrote slow SQL queries and removed redundant database calls in approval and reporting flows, bringing response times under one second.

Document Review & Automation Platform | *Java, Python, MySQL*

- Built a Java document processing system for intranet deployment, with role-based access and data isolation per reviewer group.
- Built a Python decision-tree rule engine covering 150+ business rules, cutting document review from 1–2 hours to 10–20 minutes.
- Added an operator feedback loop to flag and correct wrong rule outcomes, feeding the corrections back into the rule set.
- Moved long-running document jobs to background processing with persisted state, so failed runs resume instead of restarting.

Projects

Garage Management CRM Platform

2024

Java, Spring Boot, MySQL, Redis, AWS, OAuth2, JWT

- Designed a multi-tenant architecture for 50+ garages and 1,000+ daily job cards, isolating tenants at the query layer so no request could reach another tenant's records.
- Handled online payments with retry and webhook reconciliation, preventing duplicate charges and lost billing records on gateway failures.
- Cut read latency below one second under load using Redis caching and indexed query rewrites on job card and inventory lookups.
- Secured REST APIs with JWT and OAuth2, backed by 5-role RBAC with per-user permission overrides instead of hardcoded checks.

Education

CDAC, Pune | PG Diploma in Advanced Computing — A Grade

Sep 2023 – Feb 2024

GH Rasoni College of Engineering, Nagpur | B.Tech., Computer Science — 81.3%

2020 – 2023
